

ONLINE SECURITY TOOLS

PASSWORD MANAGERS

Password managers are tools that allow you to store your passwords in a secure “vault”. This vault is protected by a single strong password, meaning you only need to remember this one password. All of your other passwords can be retrieved from your password manager. This means you can have unique strong passwords across all your accounts online.

Many popular password managers also have browser extensions that you can use that will recognise which websites you have accounts with and will auto fill your login credentials.

A list of popular password managers and their pros vs. cons can be found online at secureyourself.net/managers

TWO-FACTOR AUTHENTICATION

Two-factor authentication - or 2FA - is a method that greatly improves the security of your credentials by making sure that the person trying to access your account is actually you. 2FA achieves this by sending you a code either through a text message or via an 2FA mobile app which you then need to submit to the website so that it can verify that it is in fact you trying to log in.

Many of the most popular websites offer 2FA including Google, Facebook, Instagram, Twitter and Apple.
